# C/C++ programming language II

Introduction  
to C and C++

Iuliana  
Bocicor

C/C++  
programming  
language

Syntax

Data types

Variables and  
constants

Pointers

Statements

Functions

Summary

## Why C/C++?:

- widely used, both in industry and in education;
- high level programming language, powerful, versatile;
- C++ is a hybrid (multi-paradigm) programming language, implements all the concepts needed for object oriented programming;
- can be used to create a wide range of software programmes, from system software like operating systems and compilers to applications like video games, search engines, and web browsers;
- after 40 years from its creation, C++ is still one of the most popular and powerful languages in the world;

# C/C++ programming language III

Introduction  
to C and C++

Iuliana  
Bocicor

C/C++  
programming  
language

Syntax

Data types

Variables and  
constants

Pointers

Statements

Functions

Summary

- the following are entirely or partially written in C or C++:
  - Adobe applications;
  - Microsoft Windows (kernel in C);
  - Microsoft Office;
  - Microsoft Visual Studio;
  - Google Chrome;
  - software at NASA, for space exploration, robotics, mission control systems, spacecraft monitoring, software for the International Space Station.
- C and C++ are extensively used in robotics, embedded systems and artificial intelligence;
- many programming languages are based on C/C++ (Java, C#). Knowing C++ makes learning other programming languages easier.

# C/C++ programming language IV

Introduction  
to C and C++

Iuliana  
Bocicor

C/C++  
programming  
language

Syntax

Data types

Variables and  
constants

Pointers

Statements

Functions

Summary

- C/C++ programs are generally faster than programs written in other programming languages;
- C/C++ allows writing programs for any type of processor or operating system (very suitable for system-level programming);
- C++ is an evolving language;
- C++ is highly standardised;
- C++ gets compiled into processor instructions (no interpretation engine needed).

# C/C++ programming language V

Introduction  
to C and C++

Iuliana  
Bocicor

C/C++  
programming  
language

Syntax

Data types

Variables and  
constants

Pointers

Statements

Functions

Summary

However, there are also a few disadvantages:

- It's complex and it takes time to learn and master.
- Security vulnerabilities related to memory access (buffer overflows, out-of-bounds reads, and memory leaks).

# Integrated Development Environment for C/C++

Introduction  
to C and C++

Iuliana  
Bocicor

C/C++  
programming  
language

Syntax

Data types

Variables and  
constants

Pointers

Statements

Functions

Summary

## Microsoft Visual Studio 2022 Community (or Professional/Express/Premium)

- download from <https://visualstudio.microsoft.com/vs/>;
- offers both an IDE and a compiler.

## CLion

- download from: <https://www.jetbrains.com/clion/>
- works with Microsoft, macOS and Linux compile toolchains

## Other options:

- Visual Studio Code
- Eclipse CDT

# Hello World Demo

Summary

## DEMO

Hello World! (*HelloWorldC.c*, *HelloWorld.cpp*).

# The compilation process I

Introduction  
to C and C++

Iuliana  
Bocicor

C/C++  
programming  
language

Syntax

Data types

Variables and  
constants

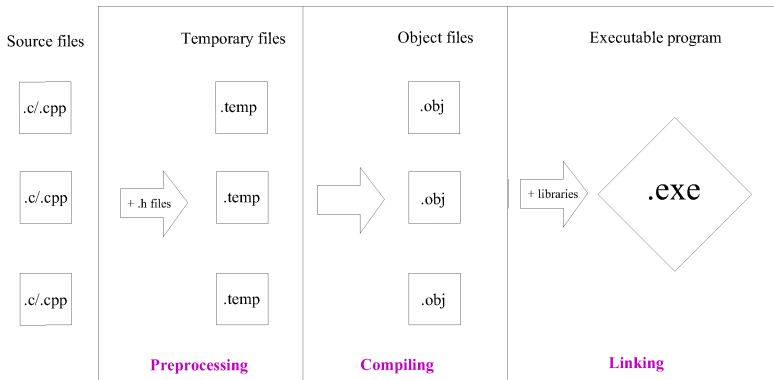

Pointers

Statements

Functions

Summary

The compiler translates source code into machine code.

# The compilation process II

Introduction  
to C and C++

Iuliana  
Bocicor

C/C++  
programming  
language

Syntax

Data types

Variables and  
constants

Pointers

Statements

Functions

Summary

- All these steps are performed before you start running a program. This is one of the reasons C/C++ code runs far faster than code in many more recent languages.
- **?** Are source code files sufficient for someone to execute your program? In which conditions?
- **?** What is the advantage of a compiled language?

# The compilation process III

Introduction  
to C and C++

Iuliana  
Bocicor

C/C++  
programming  
language

# Structure of a simple C/C++ program

Introduction  
to C and C++

Iuliana  
Bocicor

C/C++  
programming  
language

Syntax

Data types

Variables and  
constants

Pointers

Statements

Functions

Summary

- Preprocessor directives - e.g. for using libraries;

```
#include <stdio.h>
#include <iostream>
```

- *main* - special function that is called by the OS to run the program;

```
int main()
{
    //...
    return 0;
}
```

- Every statement must end with a semicolon.

# Debugging

Introduction  
to C and C++

Iuliana  
Bocicor

C/C++  
programming  
language

Syntax

Data types

Variables and  
constants

Pointers

Statements

Functions

Summary

- Allows us to step through the code, as it is running;
- Execution can be paused at certain points;
- The effects of individual statements can be seen;
- Allows inspecting the current state of the program (values of variables, call stack);
- Breakpoints - stop the program when reaching the breakpoint.

# Lexical elements I

Introduction  
to C and C++

Iuliana  
Bocicor

C/C++  
programming  
language

Syntax

Data types

Variables and  
constants

Pointers

Statements

Functions

Summary

C/C++ is case sensitive.

## Identifier:

- Sequence of letters and digits, start with a letter or `_` (underline);
- Names of things that are not built into the language;
- E.g.: `i`, `myFunction`, `res`, `_nameOfVariable`.

## Keywords (reserved words):

- Identifier with a special purpose;
- Words with special meaning to the compiler;
- E.g.: `int`, `for`, `typedef`, `struct`.

# Lexical elements II

Introduction  
to C and C++

Iuliana  
Bocicor

C/C++  
programming  
language

Syntax

Data types

Variables and  
constants

Pointers

Statements

Functions

Summary

## Literals:

- Basic constant values whose value is specified directly in the source code;
- E.g.: "Hello", 72, 4.6, 'c'.

## Operators:

- Mathematical: e.g. +, -, \*;
- Logical: e.g. !, &&.

## Separators:

- Punctuation defining the structure of a program: e.g. ";", "{ }", "( )".

# Lexical elements III

Introduction  
to C and C++

Iuliana  
Bocicor

C/C++  
programming  
language

Syntax

Data types

Variables and  
constants

Pointers

Statements

Functions

Summary

**Whitespace:** Spaces of various sorts, ignored by the compiler: space, tab, new line.

**Comments:** ignored by the compiler.

```
// This is a single line comment.
```

```
/*  
This is  
a multiline  
comment.  
*/
```

# Data types

Introduction  
to C and C++

Iuliana  
Bocicor

C/C++  
programming  
language

Syntax

Data types

Variables and  
constants

Pointers

Statements

Functions

Summary

A **type** is a domain of values and a set of operations defined on these values.

C/C++ are strongly typed languages.

## Fundamental data types in C:

- char (1 byte)
- int (4 bytes)
- unsigned int (4 bytes)
- long int/long (4 bytes)
- float (4 bytes)
- double (8 bytes)
- long double (8 bytes)

Data types in C++: <https://msdn.microsoft.com/en-us/library/s3f49ktz.aspx>.

# Casting

Introduction  
to C and C++

Iuliana  
Bocicor

C/C++  
programming  
language

Syntax

Data types

Variables and  
constants

Pointers

Statements

Functions

Summary

- implicit casting;
- static\_cast.

## DEMO

Type casting (*Casting.cpp*).

# Arrays

Introduction  
to C and C++

Iuliana  
Bocicor

C/C++  
programming  
language

Syntax

Data types

Variables and  
constants

Pointers

Statements

Functions

Summary

If  $T$  is an arbitrary basic type:

- $T \text{ arr}[n]$  - is an array of length  $n$  with elements of type  $T$ ;
- indexes are from 0 to  $n-1$ ;
- indexing operator:  $[ ]$ ;
- compare 2 arrays by comparing the elements;
- multidimensional arrays:  $\text{arr}[n][m]$ .

## DEMO

Arrays (*Arrays.c*).

# C String

Introduction  
to C and C++

Iuliana  
Bocicor

C/C++  
programming  
language

Syntax

Data types

Variables and  
constants

Pointers

Statements

Functions

Summary

- Represented as char arrays, the last character is '\0' (marks the end of the string);
- Handled as any ordinary array;
- Standard library for string manipulation in C (*string.h*);
  - `strlen` - Returns the number of chars in a C string.
  - `strcpy` - Copies the characters from the source string to the destination string.  
**Obs.** The assignment operator will not copy the string (or any array).

# C String

Introduction  
to C and C++

Iuliana  
Bocicor

C/C++  
programming  
language

Syntax

Data types

Variables and  
constants

Pointers

Statements

Functions

Summary

- Standard library for string manipulation in C (*string.h*);
  - **strcmp** - Compares two strings and returns: *zero*, if  $a = b$ ; *negative*, if  $a < b$ ; *positive*, if  $a > b$ .  
**Obs.** Using  $==$ ,  $<$ ,  $>$  operators on C strings (or any array) compares memory addresses.
  - **strcat** - Appends the characters from the source string to the end of destination string.

**Obs.** None of these string routines allocate memory or check that the passed in memory is the right size.

## DEMO

CStrings (*CStrings.c*).

# Record - composite type

Introduction  
to C and C++

Iuliana  
Bocicor

C/C++  
programming  
language

Syntax

Data types

Variables and  
constants

Pointers

Statements

Functions

Summary

- is a collection of items of different types;
- group various data types into a structure.
- declared using `struct`.

`typedef` - Introduce a new name for an existing type.

## DEMO

Records (*StructExample.c*).

# Variables

Introduction  
to C and C++

Iuliana  
Bocicor

C/C++  
programming  
language

Syntax

Data types

Variables and  
constants

Pointers

Statements

Functions

Summary

- A variable is a named location in memory;
- Memory is allocated according to the type of the variable;
- The types tell the compiler how much memory to reserve for it and what kinds of operations may be performed on it;
- The value of the variable is undefined until the variable is initialized;
- *It is recommended to initialise the variables (with meaningful values) at declaration;*
- Use suggestive names for variables.

# Constants

Introduction  
to C and C++

Iuliana  
Bocicor

C/C++  
programming  
language

Syntax

Data types

Variables and  
constants

Pointers

Statements

Functions

Summary

- Can be defined using the `#define` preprocessor directive, or the `const` keyword;
- Can be:

- *integer*

```
#define LENGTH 10  
const int LENGTH = 10;
```

- *floating*

```
#define PI 3.14
```

- *string literal*

```
const char* pc = "Hello";
```

- *enumeration constant*

```
enum colors {RED, YELLOW, GREEN, BLUE};
```

- More about const at <http://duramecho.com/ComputerInfo/WhyHowCppConst.html>

# Pointers I

Introduction  
to C and C++

Iuliana  
Bocicor

C/C++  
programming  
language

Syntax

Data types

Variables and  
constants

Pointers

Statements

Functions

Summary

- Every variable is a named memory location;
- A pointer is a variable whose value is a memory location (can be the address of another variable).

**Declaration:** same as declaring a normal variable, except an asterisk (\*) must be added in front of the variable's identifier.

```
int* x;
```

```
char* str;
```

## Operators

- *address of operator* & - take the address of a variable;
- *dereferencing operator* \* - get the value at the memory address pointed to.

## DEMO

Pointers (*Pointers.c*).

# Pointers II

Introduction  
to C and C++

Iuliana  
Bocicor

C/C++  
programming  
language

Syntax

Data types

Variables and  
constants

Pointers

Statements

Functions

Summary

```
a_pointer = 0x0018f8c4  
&a_pointer = 0x0018faec  
*a_pointer = 10
```

```
a_variable = 10  
&a_variable = 0x0018f8c4
```

# Pointers III

Introduction  
to C and C++

Iuliana  
Bocicor

C/C++  
programming  
language

Syntax

Data types

Variables and  
constants

Pointers

Statements

Functions

Summary

# Statements

Introduction  
to C and C++

Iuliana  
Bocicor

C/C++  
programming  
language

Syntax

Data types

Variables and  
constants

Pointers

Statements

Functions

Summary

- A statement is a unit of code that does something - a basic building block of a program.
- Except for the compound statement, in C and C++ every statement is ended by ";".

## Statements in C and C++:

- Empty statement;
- Compound statement;
- Conditional statement: *if, if-else, else if, switch-case*;
- Loops: *while, do-while, for*.

### DEMO

Statements (*Statements.c*).

# Read/Write from/to console

Introduction  
to C and C++

Iuliana  
Bocicor

C/C++  
programming  
language

Syntax

Data types

Variables and  
constants

Pointers

Statements

Functions

Summary

- `scanf` - read from the command line
  - <http://www.cplusplus.com/reference/cstdio/scanf/>
- `printf` - print to the console (standard output)
  - <http://www.cplusplus.com/reference/cstdio/printf/>

## DEMO

Read and Write (*ReadWrite.c*).

# Functions

Introduction  
to C and C++

Iuliana  
Bocicor

C/C++  
programming  
language

Syntax

Data types

Variables and  
constants

Pointers

Statements

Functions

Summary

- A function is a group of related instructions (statements) which together perform a particular task. The name of the function is how we refer to these statements.
- The *main* function is the starting point for every C/C++ program.

## Declaration (Function prototype)

<result type> name (<parameter list>);

```
/*  
Computes the greatest common divisor of two  
positive integers.  
Input: a, b integers, a, b > 0  
Output: returns the the greatest common  
divisor of a and b.  
*/  
int gcd(int a, int b);
```

# Functions

Introduction  
to C and C++

Iuliana  
Bocicor

C/C++  
programming  
language

Syntax

Data types

Variables and  
constants

Pointers

Statements

Functions

Summary

## Definition

```
< result type> name (< parameter list >)  
{  
    // statements - the body of the function  
}
```

- **return** <exp> - the result of the function will be the expression value and the function is unconditionally exited.
- A function that returns a result (not void) must include at least one return statement.
- The declaration needs to match the function definition.

# Specification

Introduction  
to C and C++

Iuliana  
Bocicor

C/C++  
programming  
language

Syntax

Data types

Variables and  
constants

Pointers

Statements

Functions

Summary

- meaningful name for the function;
- short description of the function (the problem solved by the function);
- meaning of each input parameter;
- conditions imposed over the input parameters (precondition);
- meaning of each output parameter;
- conditions imposed over the output parameters (post condition).

# Function invocation

Introduction  
to C and C++

Iuliana  
Bocicor

C/C++  
programming  
language

Syntax

Data types

Variables and  
constants

Pointers

Statements

Functions

Summary

`<name>(<parameter list>);`

- All argument expressions are evaluated before the call is attempted.
- The list of actual parameters need to match the list of formal parameters (types).
- Function declaration needs to occur before invocation.

# Variable scope and lifetime I

Introduction  
to C and C++

Iuliana  
Bocicor

C/C++  
programming  
language

Syntax

Data types

Variables and  
constants

Pointers

Statements

Functions

Summary

**Scope:** the place where a variable was declared determines where it can be accessed from.

## Local variables

- Functions have their own scopes: variables defined inside the function will be visible only in the function, and destroyed after the function call.
- Loops and if/else statements also have their own scopes.
- Cannot access variables that are out of scope (compiler will signal an error).
- A variable lifetime begins when it is declared and ends when it goes out of scope (destroyed).

# Variable scope and lifetime II

Introduction  
to C and C++

Iuliana  
Bocicor

C/C++  
programming  
language

Syntax

Data types

Variables and  
constants

Pointers

Statements

Functions

Summary

## Global variables

- Variables defined outside of any function are global variables. Can be accessed from any function.
- The scope is the entire application.
- **Do not** use global variables unless you have a very good reason to do so (usually you can find better alternatives).

# Function parameters I

Introduction  
to C and C++

Iuliana  
Bocicor

C/C++  
programming  
language

Syntax

Data types

Variables and  
constants

Pointers

Statements

Functions

Summary

## Pass by value

E.g.

```
void byValue(int a)
```

- Default parameter passing mechanism in C/C++.
- On function call C/C++ makes a copy of the actual parameter.
- The original variable is not affected by the change made inside the function.

# Function parameters II

Introduction  
to C and C++

Iuliana  
Bocicor

C/C++  
programming  
language

Syntax

Data types

Variables and  
constants

Pointers

Statements

Functions

Summary

## Pass by reference

In C:

- there is no *pass by reference*;
- it is simulated with pointers;
- pointers are passed by value.

E.g.

**C**

```
void byRefC(int* a)
```

**C++**

```
void byRef(int& a)
```

# Function parameters III

Introduction  
to C and C++

Iuliana  
Bocicor

C/C++  
programming  
language

Syntax

Data types

Variables and  
constants

Pointers

Statements

Functions

Summary

- The memory address of the parameter is passed to the function.
- Changes made to the parameter will be reflected in the invoker.
- Arrays are passed "by reference".

## DEMO

Functions (*Functions.cpp*).

# Test functions

Introduction  
to C and C++

Iuliana  
Bocicor

C/C++  
programming  
language

Syntax

Data types

Variables and  
constants

Pointers

Statements

Functions

Summary

## Assert

```
#include <assert.h>
void assert(int expression);
```

- if *expression* is evaluated to 0, a message is written to the standard error device and the execution will stop.
- the message includes: the expression whose assertion failed, the name of the source file, and the line number where it happened.

# Function design guidelines

Introduction  
to C and C++

Iuliana  
Bocicor

C/C++  
programming  
language

Syntax

Data types

Variables and  
constants

Pointers

Statements

Functions

Summary

- Single responsibility principle.
- Use meaningful names (function name, parameters, variables).
- Use naming conventions (`add_rational`, `addRational`, `CONSTANT`), be consistent.
- Specify and test functions.
- Include comments in the source code.
- Avoid functions with side effects (if possible).

# Summary

Introduction  
to C and C++

Iuliana  
Bocicor

C/C++  
programming  
language

Syntax

Data types

Variables and  
constants

Pointers

Statements

Functions

Summary

- Both C and C++ are compiled languages.
- All C/C++ programs must contain a *main* function.
- All variables must have types and are recommended to be initialised.
- A variable lifetime begins when it is declared and ends when it goes out of scope (destroyed).
- C/C++ allow the use of pointers.
- Function parameters can be passed by value or by reference (C++).
